

Relative contribution of individual interventions – Cases

Each lever simulated in isolation from a no-intervention baseline; shares can overlap and need not sum to 100%

Cases/deaths averted by this intervention alone, as % of total averted by the full historical response

Excludes Latrines (used in 1/12 zones) and 2nd vaccine dose (used in 0/12 zones). Contribution = (add-one-in scenario) vs (no interventions), as % of (no interventions vs fitted response).
KNOWN ISSUE: Vaccination currently shows 0% for every zone due to a bug in how vax1_start/vax1_end/vax1_total_doses were computed at the fitting stage (fixed in 01_02_fitting_all_HZs.R but not yet reflected in the saved fit). Please re-run the fit for the 7 affected zones before trusting this panel. 3 interval(s) extend beyond the axis range shown (x-axis clipped to -150 to 250% for readability).
